Mass effect on the orbits can lead to clinical presentations such as proptosis, orbital pain, and diplopia. In most cases, the effect is caused by soft-tissue lesions. However, vascular lesions, either within the orbits or extraorbital, can alter the normal orbital blood flow pattern and lead to vascular engorgement and an orbital mass effect [1, 2]. More confusingly, soft-tissue

VASCULAR LESIONS OF THE ORBIT The orbital manifestations of a vascular process are dependent on whether the lesion is on the venous or the arterial circulation. Patients with venous lesions (varix) characteristically report a history of intermittent proptosis with either a Valsalva's-type maneuver or having the head in a dependent position.
