Because of this, sophisticated credit risk models are being developed or demanded by banks to assess the risk of their credit portfolio better by recognizing the different underlying sources of risk. As a consequence, not only default probabilities for certain rating categories but also the probabilities of moving from one rating state to another are important issues in such models for risk management and pricing.

CREDIT RISK MODELLING: CURRENT PRACTICES AND APPLICATIONS

The formula of Credit Risk One of the simplest methods for calculating credit risk loss is the formula for expected loss, which is computed as the product of the probability of default (PD), exposure at default (EAD), and one minus loss has given default (LGD). Mathematically, it is represented as, Expected loss = PD * EAD * (1 - LGD)

Credit Risk (Formula, Types) | How to Calculate Expected Loss?

Reduced form credit risk models focus on modeling the probability of default rather than trying to explain default in terms of the firm's asset value. Large financial institutions employ default models of both the structural and reduced form types. The Merton structural default probabilities were first offered by KMV LLC in the early 1990s.
