Entomology (from Ancient Greek ἔντομον (entomon) 'insect', and -λογία () 'study of') is the scientific study of insects, a branch of zoology. In the past the term "insect" was less specific, and historically the definition of entomology would also include the study of animals in other arthropod groups, such as arachnids, myriapods, and crustaceans.

Forensic entomology is the scientific study of the invasion of the succession pattern of arthropods with their developmental stages of different species found on the decomposed cadavers during legal investigations. It is the application and study of insect and other arthropod biology to criminal matters. It also involves the application of the study of arthropods, including insects, arachnids ...

...

Insect, any member of the class Insecta, the largest class of phylum Arthropoda. Insects have segmented bodies, jointed legs, and exoskeletons. They are distinguished from other arthropods by their body, which has three major regions: the head, the three-segmented thorax, and the many-segmented abdomen.

Millipedes live outdoors in damp areas such as under leaves, needles and dead plant debris, or in cracks and crevices. They feed on damp and decaying vegetable matter and are beneficial as "recyclers" of organic matter. However, they become a pest when they migrate into buildings as accidental invaders. Millipedes are usually found in the garage, basement or lowest level although they may ...

exoskeleton, rigid or articulated envelope that supports and protects the soft tissues of certain animals. The term includes the calcareous housings of sessile invertebrates such as clams but is most commonly applied to the chitinous integument of arthropods, such as insects, spiders, and crustaceans. The arthropod exoskeleton, formed from the epidermis, is composed of an outer waxy, water ...

Life habit. The order has a worldwide distribution, but most species are found in the tropics. These tropic species vary from stick-like species to those resembling bark, leaves and even moss or lichen. The stick insect can sometimes reach over 13 inches (33 cm) long. The longest is Chan's megastick.. A few species, such as *Carausius morosus*, are even able to change their pigmentation to match

Darwinism designates a distinctive form of evolutionary explanation for the history and diversity of life on earth. Its original formulation is provided in the first edition of *On the Origin of Species* in 1859. This entry first formulates 'Darwin's Darwinism' in terms of five philosophically distinctive themes: (i) probability and chance, (ii) the nature, power and scope of selection ...

Halophiles are organisms that need salt in their environment to live. Halophiles live in evaporation ponds or salt lakes such as Great Salt Lake, Owens Lake, or Dead Sea. The name "halophile" comes from Greek for "salt-loving". Most halophiles are archaeans, but some bacteria and eukaryotes are also
