Let l and k be two integers such that $l|k$. Define $T_l(X) := X + X^l + \dots + X^{pk-2l} + X^{pk-l}$ and $S_l(X) := X - X^l + \dots + (-1)^{(k/l-1)} X^{pk-l}$, where p is any prime. This paper g...

Solving some affine equations over finite fields

The book is well documented, and could serve as a good resource for graduate students interested in equations over finite fields. A small warning: there is no index, so you'll have to rely on the table of contents. But if you remember where things are, then you'll have a decent reference book.

We have seen that for each prime p , there is a field F_p of p elements. In fact, given any prime p and an integer $r \geq 1$, there is one and only one field F_{p^r} of $q = p^r$ elements. The field $F_{p^r} \supseteq F_p$ and for each α in F_{p^r} , $p\alpha = 0$. Conversely, any finite field is F_{p^r} , for some $q = p^r$ (cf. Ref. 18). The field F_{p^r} is characterized by the property

Finite fields I talked in class about the field with two elements $F_2 = \{0,1\}$ and we've used it in various examples and homework problems. In these notes I will introduce more finite fields $F_p = \{0,1,\dots,p-1\}$ for every prime number p . I'll say a little about what linear algebra looks like over these fields, and why you might care.

Whether we are operating in a prime field or an extension of a prime field (what the OP calls gf or GF) has relatively little to do with the matter. In particular, for linear equations, the general theory of linear equations over a field usually has more to say about the matter than the identity of the field.

Solutions in a finite field. When solving a system over a finite field k with q elements, one is primarily interested in the solutions in k . As the elements of k are exactly the solutions of the equation $x^q - x = 0$, it suffices, for restricting the solutions to k , to add the equation $x^i q - x^i = 0$ for each variable x^i .

Let K be a field over which the curve is defined (i.e., the coefficients of the defining equation or equations of the curve are in K) and denote the curve by E . Then the K -rational points of E are the points on E whose coordinates all lie in K , including the point at infinity. The set of K -rational points is denoted by $E(K)$.

This dissertation investigates the existence of solutions to equations over finite fields with an emphasis on diagonal equations. In particular: Given a system of equations, how many solutions are there? In the case of a system of diagonal forms, when does a nontrivial solution exist? Many results are known that address (1) and (2), such as the classical Chevalley-Waring theorems.
