ISO 1940 is based on the measurement of machinery vibration velocity The ANSI spec is identical but printed by American National Standards Institute. The API specification is written around pump requirements in the Petro-Chemical Industries and classifies unbalance levels as a function of rotor mass and operating speed (Norfield, 2006).

Rotating Machinery Rotor Balancing - Lifetime Reliability
Balance Quality Grade ISO 1940/1 What is mean by G 0.4, G 1.0, G 2.5, G 6.3 and so on? G is the product of specific unbalance & the angular velocity of the rotor at maximum operating speed. What is specific unbalance? Specific unbalance - center of gravity displacement of rotor.

Balancing requirement according to iso 1940
Balance Grades Balance Grades are used to specify the allowable residual imbalance for rotating machinery. The ISO 1940 standard defines balance grades for different classes of machinery. (Rigid Rotors Only*) Example: Balance Grade "G2.5" is recommended for Steam Turbines, Machine Tools and Small Electric Armatures.
